VoiceNet
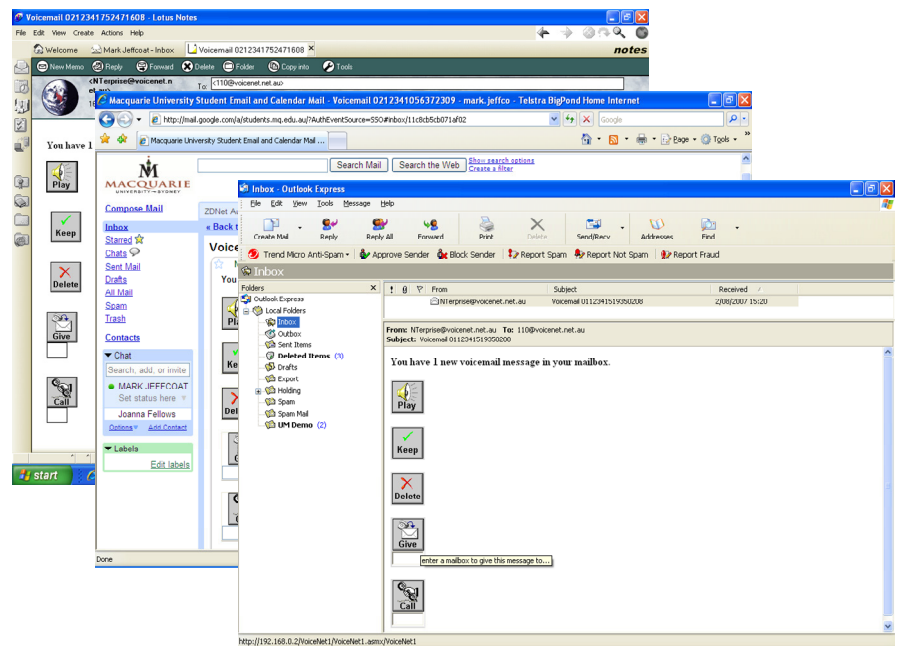

NTerprise®

Unified messaging brings platform - independent voice and fax message notification and realtime handling through web services from within any email client.

Key Benefits

o **one point of delivery for voice, fax and email messages from within any email client on any platform**

o **no special software required on any user's desktop or office email server**

o **service rollout is simplified for IT department**

Overview

Unified messaging from the NTerprise® voicemail system consists of new voicemail and faxmail message notifications being delivered via intranet or internet to your email Inbox. The unified messaging delivery scheme employed by the NTerprise® system is designed for scalability, and importantly it does not include a WAV file attachment (which can be very large in size) as a copy of your voicemail message, unless you specifically request this option (for example, you might be on the road / away from your office for some time) and not able to access your intranet.

Message Handling

The message handling buttons provide the facilities to play the message over speakers by streaming the voicefile in realtime over your LAN, have voicemail call you on the phone to play and handle your messages, delete, keep and give the message to another mailbox owner, and view the message if it is a fax.

Fax

Faxmail notifications to your email include a ".tif/pdf" file attachment for the received and stored fax. Native tif readers are included in all Windows operating systems, and the converted tif/pdf files are relatively small in size, making this delivery scheme the most convenient and sensible for email notification and handling of faxes received through a fax server.

Simplicity

Service rollout is simplified for IT departments since there is no installation required to the desktop or email server. Users simply point and click from within their email client to play or handle their unified messages.
